

verot.net - class.upload.php translations

[php class upload translations.htm](#)

Since version 0.25, the class error messages can now be translated. If your language is not listed below, [send me your own translation!](#)

How to use the translation files?

Instantiate the class with a second argument being the language code. For instance, for the French language, you need to have the file `class.upload.fr_FR.php` in a directory `lang/`, below the main upload class. Then, instantiate the class as following:

```
$handle = new upload($_FILES['image_field'], 'fr_FR');  
$handle = new upload('/home/user/myfile.jpg', 'fr_FR');
```

Note that the class is by default in English. If you only needs English language, you don't need any translation files.

How to create translations?

You can use [this file](#) as a template to create new language files. In the file, the messages are provided in English; simply change the text in the array (don't change any keys!). Then, put your name in the file, and replace all the xxxx that can be there. Rename the file with your language code instead of xx_XX, and [send it to me](#).

The file must be edited in UTF-8, but don't save it with the BOM bit. You can use an editor such as [Scite](#) to open the file, and then select File > Encoding > UTF-8 Cookie to see the characters properly.

Translations available

Here is a list of the translations available. Although there are also provided in the [packages](#), you can get the latest versions here. Download it, replace the `.txt` extension with `.php`, and you're done.

- **Traditional Chinese** translation by Yang Chih-Wen. [Download here](#)

It is normal that some files appear with some weird characters. It is because the translations are in UTF-8, but without the BOM byte. Simply use the file as is, and set your web page to be in UTF-8.
